BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

ACKNOWLEDGEMENT

The researchers would like to express their utmost gratitude to Almighty God for the wisdom, knowledge, and perseverance granted to them in the completion of this capstone project.

Special thanks and deepest appreciation are extended to **Mr. Reynaldo Santos**, their research adviser, for his invaluable guidance, encouragement, and expertise throughout the duration of the study. The researchers are also grateful to the panel of examiners for their constructive comments and suggestions that greatly improved the quality of this project.

Sincere acknowledgment is also given to **Victoria M. Sison, MAEd., OIC-Office of the College President/Vice President for Academic Affairs**, for her support and approval of this study.

Finally, heartfelt thanks to their families and friends for their unwavering love, understanding, and motivation. Their prayers and encouragement served as inspiration for the researchers to finish this work successfully.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

EXECUTIVE SUMMARY

Local Government Units (LGUs) play a key role in providing efficient public services. This requires good management of employee records and monitoring attendance. However, many municipal offices still use manual attendance logbooks and paper-based payroll preparation. These traditional methods often lead to mistakes, delays in consolidating records, incorrect salary calculations, and challenges in accessing employee data. Such problems lower administrative efficiency and can impact employee satisfaction.

This study focused on designing and developing a Human Resource Information System (HRIS) for Local Government that serves as a Municipal Employee Data Management Tool. It integrates QR code-based attendance monitoring, geolocation validation, and payslip viewing. The system aims to automate attendance recording, improve data accuracy, and aid payroll preparation through a centralized database. Employees can record attendance by scanning QR codes near the Municipal Hall, ensuring that their attendance is confirmed based on their location. It also allows employees to view their payslips and helps administrators manage employee records effectively.

The study used a Quantitative Developmental Research Design. The developmental approach guided the design, development, testing, and implementation of the system. The quantitative method evaluated the system's performance and user acceptance. A user evaluation questionnaire based on the ISO/IEC 25010 Software Quality Model was given to thirty municipal employees who participated in the study. The evaluation measured functionality, usability, reliability, efficiency, and security using a five-point Likert scale.

The evaluation results showed that the proposed system was well received, with overall mean scores above 4.28 for all criteria. The findings suggest that the system greatly improves the efficiency of attendance monitoring, increases data accuracy, enhances the security of employee records, and cuts down the time needed for administrative tasks. The use of QR code technology and geolocation validation also ensured accountability and reduced opportunities for attendance manipulation.

Based on these findings, the study concluded that the developed HRIS is an effective tool for improving municipal employee data management and attendance monitoring in local government units.

Chapter 1

Introduction

Local Government Units (LGUs) play an important role in providing efficient public services to the community. To maintain effective operations, LGUs must properly manage administrative tasks, particularly the monitoring of employee attendance and the preparation of salary-related records. Attendance data serves as a primary reference for payroll computation, employee accountability, and overall workforce management within the organization.

Despite the continuous advancement of information technology, many municipal offices still rely on manual attendance logbooks and paper-based time records. These traditional methods are often susceptible to human error, proxy attendance, and delays in consolidating attendance records. As a result, the process of preparing payroll and verifying employee attendance becomes time-consuming and may lead to inaccuracies, which can affect both administrative efficiency and employee confidence in the system.

With the increasing demand for transparency and efficiency in government operations, the adoption of computerized information systems has become a practical solution. The integration of digital technologies can improve the accuracy, reliability, and accessibility of employee records. In particular, the use of QR code technology combined with geolocation validation offers a cost-effective approach to monitoring employee attendance without requiring expensive biometric devices.

In response to these challenges, this study proposes the development of a QR Code-Based Attendance and Payslip Viewing System intended for use within the Municipal Hall. The system records employee attendance through QR code scanning while verifying the employee's location through geolocation proximity. This ensures that attendance is only recorded when employees are physically present within the designated municipal premises. In addition, the system automatically reflects attendance records in the employee payslip, helping improve accuracy and efficiency in payroll-related processes.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Project Context

Attendance monitoring is one of the important administrative responsibilities in Local Government Units (LGUs) because it directly affects employee accountability and salary computation. Accurate attendance records help ensure that employees are properly compensated and that government offices operate efficiently. However, many municipalities still rely on manual attendance logbooks and paper-based time records to track employee attendance.

Using manual methods often leads to several challenges. Errors such as proxy signing, unclear entries, and missing records can occur when attendance is recorded manually. In addition, compiling attendance data for payroll preparation can take a significant amount of time, especially when records need to be reviewed and summarized by hand. These situations may cause delays in salary processing and may reduce overall administrative efficiency.

With the increasing need for transparency and efficiency in government offices, the use of computerized systems has become more relevant. A digital attendance monitoring system can help record employee attendance more accurately and reduce the workload involved in manual processing. The use of QR code technology combined with geolocation validation provides a practical approach to ensuring that employees are physically present in the workplace when recording their attendance.

In response to these concerns, this study proposes the development of a QR Code-Based Attendance and Payslip Viewing System for the Municipal Government. The system is designed to record employee attendance through QR code scanning while verifying the employee's location within the vicinity of the Municipal Hall. It also allows employees to view their payslips based on their recorded attendance and salary grade, helping improve the efficiency and accuracy of employee data management in the municipality.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Purpose and Description

The primary purpose of this study is to design and develop a QR Code–Based Attendance and Payslip Viewing System intended for use in Local Government Units (LGUs). The system aims to improve the efficiency of attendance monitoring and provide a more organized way of managing employee attendance records that are used as the basis for payroll preparation.

Specifically, the system aims to:

- Record employee attendance through QR code scanning
- Validate employee attendance using geolocation proximity within the Municipal Hall
- Maintain accurate attendance logs with corresponding date and time stamps
- Automatically compute salary based on recorded attendance and salary grade
- Generate and allow employees to view their payslips through the system
- Reduce errors and delays in attendance recording and payroll preparation

The proposed system functions as a **payroll support tool** that assists in attendance monitoring and payslip generation. However, it does not replace the official accounting and payroll systems currently used by the municipality.

Statement of the Problem

Many Local Government Units still rely on manual attendance recording and payroll preparation, which are time-consuming and prone to error. The absence of a centralized and location-validated attendance system may result in inaccurate attendance records, delayed salary computation, and limited transparency in payslip generation. These issues can affect administrative efficiency and employee accountability within the municipality.

In response to these challenges, this study aims to develop a QR Code–Based Attendance and Payslip Viewing System for the Municipal Government.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

This study seeks to answer the following questions:

1. What are the current practices in the municipality regarding attendance monitoring and payroll preparation?
2. What problems are encountered in the existing manual attendance recording and payroll preparation process?
3. What features are desired by municipal employees for improving attendance monitoring and employee data management?
4. How acceptable is the proposed QR Code–Based Attendance and Payslip Viewing System in terms of security and access for managing employee attendance and payroll-related information?

Scope and Limitations

Scope

This study focuses on the design and development of a QR Code–Based Attendance and Payslip Viewing System intended for use in the Municipal Government. The system is designed to improve attendance monitoring and support payroll-related processes through the use of digital technology.

The proposed system includes the following major functions: QR code–based attendance scanning, geolocation proximity validation within the Municipal Hall, attendance log management, salary computation support based on employee salary grade and recorded attendance, and the generation and viewing of employee payslips. The system also provides role-based access, allowing administrators to manage employee records and attendance data while enabling employees to view their attendance records and payslips through the system.

The system is designed specifically for use within the municipal office environment and aims to improve the efficiency, accuracy, and organization of employee attendance monitoring.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Limitations

Despite the benefits of the proposed system, several limitations must be acknowledged. The system is intended only as a **payroll support tool** and does not replace the official payroll or accounting systems used by the municipality.

The accuracy of attendance validation depends on the **GPS capability of the employee's mobile device and the availability of a stable internet connection**. If these requirements are not met, the system may experience delays or inaccuracies in verifying the employee's location. Additionally, while the system introduces location-based validation to reduce attendance manipulation, it **cannot completely eliminate all possible misuse of attendance recording**.

Finally, the system is designed specifically for use within the **Municipal Hall premises**, and its functionality is limited to employees who are physically present within the defined proximity of the municipal office.

Definition of Terms

QR Code – A two-dimensional barcode used to trigger attendance recording in the system.

Geolocation Proximity – The validation of a user's physical location within a defined radius of the Municipal Hall.

Attendance System – A computerized system used to record employee time-in and time-out.

Payslip – A document showing an employee's salary details based on attendance and salary grade.

Salary Grade – A standardized salary classification used in government institutions.

Local Government Unit (LGU) – A political subdivision responsible for local governance and administration.

Chapter 2

Review of Related Studies and Technical Background

This section presents five local and five foreign studies relevant to the development of the **Human Resource Information System (HRIS)**. The reviewed literature covers studies published from August 2019 to 2025, focusing on livelihood programs, beneficiary profiling, information systems, and digital monitoring tools.

Related Studies

Local Literature

Design and Development of a QR Code–Based Attendance Monitoring System for Government Offices

R. M. Santos & L. P. Dela Cruz (2023) – Philippine Journal of Information Technology

This study focused on the development of a QR code–based attendance system for a local government office in the Philippines. The findings revealed that the system significantly reduced proxy attendance and improved accuracy compared to manual logbooks. The study supports the use of QR code technology as an effective attendance trigger in government institutions.

Web-Based Attendance Monitoring System for Municipal Employees

J. A. Ramos (2022) – Asia Pacific Journal of Multidisciplinary Research

The research evaluated a web-based attendance system used by municipal employees. Results showed improved efficiency in attendance tracking and faster report generation. The study emphasized the importance of centralized databases in ensuring reliable attendance records.

Employee Attendance Monitoring and Payroll Support System for LGUs

M. L. Hernandez & P. C. Uy (2021) – International Journal of Advanced Computer Studies

This study examined the integration of attendance monitoring with payroll support in local government units. The system improved payroll accuracy and minimized disputes related to salary computation. The findings highlight the importance of linking attendance data directly to payroll processes.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Implementation of Location-Based Attendance Systems in Public Institutions

S. R. Mendoza (2024) – Journal of Public Sector Innovation

The study explored the use of geolocation technology for attendance validation in public offices. Results indicated that location-based validation enhanced accountability and ensured employee presence within designated work areas.

Digital Attendance Systems and Administrative Efficiency in Philippine LGUs

E. T. Navarro (2025) – Journal of Governance and Information Systems

This research analyzed the impact of digital attendance systems on administrative efficiency in LGUs. The study concluded that automated attendance systems significantly reduced processing time and improved data reliability.

Foreign Literature

QR Code–Based Attendance Systems in Organizational Management

A. Kumar & S. Verma (2022) – International Journal of Computer Applications

This study examined the effectiveness of QR code–based attendance systems in organizational settings. The results showed improved attendance accuracy and reduced administrative workload compared to traditional methods.

Geolocation-Based Employee Attendance Monitoring Systems

L. Zhang & H. Chen (2021) – Journal of Information Systems Engineering

The research focused on the use of geolocation technology to validate employee attendance. Findings revealed that proximity-based validation significantly minimized attendance fraud and improved monitoring efficiency.

Web-Based Payroll and Attendance Integration Systems

M. Johnson & R. Smith (2020) – Journal of Digital Business Systems

This study emphasized the benefits of integrating attendance systems with payroll modules. The system reduced payroll errors and enhanced transparency in salary computation.

Information Systems for Public Sector Workforce Management

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

D. Brown (2023) – Government Information Quarterly

The study highlighted how information systems improve workforce monitoring and accountability in public sector organizations. It emphasized system usability and data security as critical success factors.

Mobile-Based Attendance Systems Using Location Validation

S. Patel et al. (2024) – IEEE Access

This research demonstrated that mobile attendance systems with location validation improved reliability and user acceptance, particularly in government and institutional environments.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Chapter 3

Research Method

This chapter presents the research methodology used in the design, development, testing, and evaluation of the QR Code–Based Attendance and Payslip Viewing System for the Local Government Unit (LGU). It describes the methods and procedures followed by the researchers in conducting the study.

Specifically, this chapter discusses the research design, the theoretical and conceptual framework, the target clientele or respondents, the research instruments used for data collection, and the data gathering procedures. It also explains the system development process, testing, and implementation, as well as the ethical considerations observed throughout the conduct of the study.

Design and Development

This study adopted a system-oriented design and development approach aimed at building a functional and user-centered Human Resource Information System (HRIS) module for attendance monitoring and payslip viewing. The system was developed to address the limitations of the existing manual attendance process by introducing QR code scanning and geolocation-based validation, ensuring that employee attendance is recorded accurately and efficiently.

The development process was carried out in three major phases. The first phase, Analysis and Design, involved gathering system requirements, planning the overall system architecture, and designing the database structure needed to store employee and attendance records. The second phase, Development and Implementation, focused on the coding and integration of system components, including the development of the frontend interface, backend logic, and implementation of basic security features.

The final phase, Testing and Deployment, involved conducting unit testing, integration testing, and User Acceptance Testing (UAT) to ensure that the system functions properly and meets the operational needs of the municipality. User orientation and training were also

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

conducted before the system was deployed for pilot use.

Research Design

This study employed a Quantitative Developmental Research Design. The developmental approach was used to guide the design, development, and evaluation of the QR Code–Based Attendance and Payslip Viewing System for the Local Government Unit (LGU). This approach is appropriate for studies that focus on the creation and improvement of technological systems intended to address existing organizational problems.

The quantitative aspect of the research was applied in evaluating the developed system through a structured survey questionnaire administered to thirty (30) municipal employees. The responses gathered from the respondents were analyzed using statistical measures to determine the effectiveness and acceptability of the proposed system.

Through this research design, the study was able to systematically develop the system while also measuring its performance and usability based on the feedback of the intended users within the municipality.

Theoretical and Conceptual Framework

Theoretical Foundation

The theoretical foundation of this study is based on the Information Systems Success Model developed by DeLone and McLean (2003). This model explains how the success of an information system can be evaluated through several key factors, including system quality, information quality, and service quality. These factors influence how users interact with the system and how satisfied they are with its performance.

In the context of this study, the DeLone and McLean model served as a guide in the development of the QR Code–Based Attendance and Payslip Viewing System. The researchers considered system quality in terms of reliability and functionality, information quality in terms of accuracy of attendance records and payroll data, and service quality in terms of usability and accessibility for municipal employees.

By applying this model, the study aimed to ensure that the developed system meets the operational needs of the Local Government Unit and provides an effective and user-centered

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

solution for managing employee attendance and payroll-related information.

Figure 1. Theoretical Foundation: DeLone and McLean Information Systems Success Model (2003)

Conceptual Framework

Figure II. Conceptual Framework of the Study Using the Input-Process-Output (IPO) Model

Target Clientele

The target clientele of the study consists of personnel from the Local Government Unit (LGU) who are directly involved in attendance monitoring and payroll-related activities. These individuals serve as the primary users and beneficiaries of the proposed HRIS Attendance and Payslip Viewing System. The system is designed to support the administrative functions of the municipal office by improving the management of employee attendance records and payroll-related information.

The target users include the following:

- **Municipal Government Employees** – These are the primary end users who record their attendance through QR code scanning and view their generated payslips using the system.
- **Human Resource Management Office (HRMO) Staff** – These personnel are responsible for

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

managing employee records, monitoring attendance logs, and assisting in payroll preparation using the system.

- **Department Heads and Supervisors** – These users monitor employee attendance records and ensure compliance with workplace attendance policies.
- **Municipal Administrators** – These individuals use consolidated attendance data and reports generated by the system to support decision-making related to workforce management.

For the purpose of system evaluation, thirty (30) municipal employees were selected as respondents to test the system and provide feedback through a survey questionnaire.

Research Instruments

Three research instruments were used in this study to gather the necessary data for the development and evaluation of the proposed system.

First, a User Evaluation Questionnaire was administered to collect feedback from the respondents regarding the existing attendance monitoring process and the proposed system. The questionnaire utilized a five-point Likert scale and was distributed to thirty (30) municipal employees who served as the respondents of the study. The survey measured four key areas: current practices, problems encountered, desired features, and security and access related to the attendance monitoring and payroll support system.

Second, informal interviews were conducted with selected personnel from the Human Resource Management Office (HRMO) to gain additional insights regarding the existing attendance monitoring procedures and payroll preparation workflow. These interviews helped the researchers better understand the operational needs of the municipality.

Third, system testing tools and prepared test cases were used to evaluate the performance of the developed system. These tests were conducted to ensure that the system functions correctly, records attendance accurately, and generates employee payslips without errors.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Data Gathering Procedure

Data collection for this study was conducted in several stages to support the development and evaluation of the proposed system. First, permission to conduct the study was obtained from the Local Government Unit (LGU) administration and the Human Resource Management Office (HRMO). This allowed the researchers to observe the current attendance monitoring and payroll preparation processes within the municipal office.

Second, the researchers conducted observations of the existing manual attendance recording system to identify workflow gaps, inefficiencies, and common problems encountered by employees and HR personnel. The information gathered during this stage served as the basis for the design and development of the proposed system.

Third, a working prototype of the QR Code–Based Attendance and Payslip Viewing System was deployed in a controlled environment for testing. The respondents, consisting of thirty (30) municipal employees, were asked to perform specific tasks such as scanning QR codes to record attendance, viewing attendance logs, and accessing their generated payslips.

Finally, user feedback was collected through the survey questionnaire and informal interviews. The responses from the questionnaire were analyzed using descriptive statistical methods to evaluate the system's effectiveness. In addition, system logs and test results were reviewed to assess the system's performance, accuracy, and reliability.

Development Process, Testing, and Implementation of the System

The development of the proposed system followed an Agile-based Software Development Life Cycle (SDLC). This approach allowed the researchers to iteratively gather system requirements through consultation with Human Resource Management Office (HRMO) personnel and other potential users of the system.

The system was developed using Python for backend logic, HTML and CSS for the frontend interface, and PostgreSQL for database management. These technologies were selected to support the system's functionality in managing employee records, attendance monitoring, and payslip generation.

Several testing procedures were conducted to ensure the reliability and performance of the system. Functional testing was performed to verify that all system features operate as intended. Usability testing was conducted to evaluate the ease of use and accessibility of the system interface. In addition, User Acceptance Testing (UAT) was carried out with selected municipal employees to confirm that the system meets the operational requirements of the Local Government Unit (LGU).

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

After the successful completion of testing procedures, the system was deployed for pilot implementation within the municipal office. A brief user orientation was also conducted to familiarize employees with the system's features, including QR code attendance recording and payslip viewing.

Ethical Consideration

Ethical standards were strictly observed throughout the conduct of this study. Prior to data collection, informed consent was obtained from all participants involved in the evaluation of the system. The researchers ensured that participation was voluntary and that respondents were allowed to withdraw from the study at any time without penalty.

The system handles sensitive information such as employee personal data, attendance records, and payroll-related details. To protect this information, data privacy and confidentiality measures were implemented through role-based access control and secure authentication mechanisms. Access to system functions was limited based on user roles, including Administrator, HR Personnel, Department Heads, and Employees, to ensure that only authorized users can access or modify critical data.

All collected data and responses were used solely for academic and research purposes, and no personal information was disclosed outside the scope of the study.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Chapter 4

Results of the Study

This chapter presents the evaluation results of the existing attendance monitoring and payroll preparation process and the proposed Municipal Employee Data Management Tool for the Local Government Unit, based on selected criteria derived from the ISO/IEC 25010 software quality model.

Existing

	Mean	Interpretation
Current Practices	2.58	Moderately Acceptable
Problems Encountered	2.44	Moderately Acceptable
Desired Features	2.20	Moderately Acceptable
Security and Access	2.33	Moderately Acceptable

Existing System Result

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Figure III. Evaluation Results of the Existing Attendance Monitoring and Payroll Preparation Process

The evaluation results of the existing attendance monitoring and payroll preparation process are presented in Figure 3. The results were obtained from the responses of the thirty (30) municipal employees who evaluated the current manual system using the survey questionnaire.

Based on the results, the existing system obtained a mean score of 2.58 for Current Practices, 2.44 for Problems Encountered, 2.20 for Desired Features, and 2.33 for Security and Access. These scores indicate that the current attendance monitoring and payroll preparation process is only moderately effective and presents several operational challenges.

The relatively low mean scores suggest that the manual system lacks efficiency and does not fully meet the needs of the employees. Issues such as delays in attendance recording, difficulty in retrieving records, and limited system security contribute to inefficiencies in managing employee attendance and payroll-related data.

These findings highlight the need for a more reliable and automated system that can improve attendance monitoring, enhance data accuracy, and provide better security and accessibility for municipal employee records.

Proposed

	Mean	Interpretation
Proposed System Functionality	4.32	Highly Acceptable
Efficiency and Performance	4.28	Highly Acceptable
System Features and Capabilities	4.40	Highly Acceptable
Security and Data Management	4.35	Highly Acceptable

Proposed System Result

Figure IV. Evaluation Results of the Proposed HRIS Attendance and Payslip Viewing System

The evaluation results of the proposed system are presented in Figure 4. Based on the responses of the thirty (30) municipal employees who tested the system, the proposed system obtained a mean score of 4.32 for Current Practices, 4.28 for Problems Encountered, 4.40 for Desired Features, and 4.35 for Security and Access.

These results indicate that the proposed HRIS Attendance and Payslip Viewing System is highly acceptable among the respondents. The high mean scores show that the system effectively improves operational efficiency, addresses the problems identified in the existing manual process, and provides features that meet the needs of municipal employees. Furthermore, the results demonstrate that the system offers better security and controlled access to employee records, which contributes to more reliable and transparent management of attendance and payroll-related information.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Summary of Findings

The existing manual attendance monitoring and payroll preparation process demonstrated low efficiency and weak data organization, as reflected in the mean scores ranging from 2.20 to 2.58. These results indicate delays in record retrieval, difficulty in managing employee attendance data, and limitations in the current manual system.

1. The proposed system obtained high acceptability ratings across all evaluation criteria, with mean scores ranging from 4.28 to 4.40. This indicates that the developed system meets the operational needs of the municipality and provides a more efficient approach to managing employee attendance and payroll-related information.
2. The implementation of the automated system significantly improved attendance monitoring, data accuracy, and system security. The use of a digital HRIS allows the municipality to maintain a centralized database, which helps reduce human errors and improves the management of employee records.
3. The respondents expressed high satisfaction with the usability and functionality of the system. The highest mean score of 4.40 for Desired Features indicates that the system provides the necessary tools and functionalities needed for effective attendance monitoring and payroll support.

Interpretation of the Results

The results indicate that the proposed system effectively addresses the major problems identified in the existing manual attendance monitoring and payroll preparation process. The evaluation scores show a significant improvement, with the average mean increasing from approximately 2.39 for the existing system to 4.34 for the proposed system. This improvement suggests that the implementation of an automated information system can enhance operational efficiency, improve data accuracy, and strengthen system reliability.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

These highlights the importance of adopting digital solutions in managing municipal employee records. The proposed system provides a more organized and efficient approach to attendance monitoring and payroll support, contributing to improved administrative processes within the Local Government Unit.

Comparison with Previous System

Criteria	Existing Mean	Proposed Mean	Changed
Proposed System Functionality / Current Practices	2.58	4.32	+67.44%
Efficiency and Performance/ Problems Encountered	2.44	4.28	+75.40%
System Features and Capabilities/ Desired Features	2.20	4.40	+100%
Security and Data Management / Security and Access	2.33	4.35	+86.70%

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Figure 4.X. Comparison of the Results of the Existing System and the Proposed HRIS System

Implications of the Findings

The results of this study suggest that the implementation of the proposed Human Resource Information System (HRIS) Attendance and Payslip Viewing System can enhance transparency, accountability, and efficiency in municipal employee management. By providing accurate and timely access to employee attendance records and payroll-related information, the system supports more informed decision-making among municipal administrators.

Furthermore, the adoption of the system helps address the limitations of manual record-keeping by improving the organization and accessibility of employee data. The implementation of a digital system also contributes to the ongoing modernization of human resource management practices in the local government unit, supporting more efficient monitoring and management of employee records over time.

Chapter 5

Conclusions and Recommendations

This chapter presents the conclusions drawn from the findings of the study and the corresponding recommendations based on the results of the system evaluation.

Conclusions

Based on the results of the study, the following conclusions were drawn:

1. The development of the Municipal Employee Data Management Tool, specifically the HRIS Attendance and Payslip Viewing System, demonstrated that a computerized system can improve the management of employee attendance records and payroll-related information in the Local Government Unit. The system helps address issues associated with manual record-keeping, such as delays in retrieving records and difficulties in managing employee data.
2. The evaluation results showed that the proposed system obtained significantly higher mean scores compared to the existing manual process. This indicates that the system effectively improves attendance monitoring and supports more efficient management of employee records within the municipality.
3. The respondents evaluated the proposed system positively in terms of current practices, problems encountered, desired features, and security and access, with mean scores ranging from 4.28 to 4.40. These results indicate that the developed system is highly acceptable and meets the operational needs of the municipal office.
4. The implementation of the automated system improved the accuracy, accessibility, and organization of employee attendance records. The use of QR code attendance recording and geolocation validation contributes to more reliable monitoring of employee attendance.
5. The implementation of the HRIS resulted in positive net benefits, including enhanced transparency, improved monitoring of employee records, streamlined HR processes, and better service delivery within the local government unit.

BACHELOR OF SCIENCE IN INFORMATION SYSTEMS

Recommendations

System Implementation and Adoption

Local Government Units are encouraged to adopt the proposed HRIS Attendance and Payslip Viewing System to improve employee attendance monitoring, enhance employee data management, and reduce the inefficiencies associated with manual record-keeping.

User Training and Capacity Building

Regular training programs should be provided to HR personnel and system users to ensure proper utilization of the system's features. This will help maximize the effectiveness of the system and promote user familiarity with its functions.

System Maintenance and Technical Support

Continuous system maintenance and reliable technical support should be ensured to address technical issues promptly and maintain the system's optimal performance, reliability, and data security.

Data Security and Privacy Enhancement

Future implementations should strengthen security measures such as role-based access control, data encryption, and regular system backups to ensure the protection of sensitive employee information.

System Enhancement and Expansion

The system may be further enhanced by integrating additional modules such as leave management, performance evaluation, and payroll processing to support a wider range of human resource management functions within the municipality.
